

PLANISTEEL CAMPROFILE CONVEX

Composition

- Grooved metal core in stainless steel or special alloys.
- NR convex profile
- Filler layers such as graphite, PTFE, or mica.

Characteristics

Unlike standard Kamprofile gaskets, the convex design allows for better adaptability to flange surfaces, reducing the risk of leakage. This profile helps compensate for small irregularities in the mating surface.

Applications

Camprofile Convex gaskets are primarily used in equipment subjected to significant variations in pressure and temperature, which can stress the flanged joint during operation. The temperatures at which the Camprofile Convex can be used depend on the choice of core material and filler coating, for pressure ratings ranging from class 150 up to 2500 psi (or their metric standard equivalents). Graphite cannot be used for services involving oxidizing fluids.

Planisteel Camprofile Convex

Camprofile Convex gaskets are a type of metal gasket designed to ensure high sealing performance in critical industrial applications. They are a variant of Camprofile gaskets, characterized by a convex profile that improves contact pressure distribution and optimizes performance.

The information provided in this publication, as well as that supplied to users in other forms, is based on our experience and communicated according to the best knowledge available. However, since numerous factors beyond our knowledge and control may influence the use of the products, no warranty, explicit or implicit, is given regarding such content. The operating limits indicated do not constitute confirmation that these values can be applied simultaneously. Avoid using the product at the maximum temperature and pressure limits. The maximum temperature is sustainable only for short periods under specific conditions. Specifications may be changed without notice. The images in the DS may not accurately represent the product's color and/or marking.
